In this article, we build a risk-centric macroeconomic model—that is, a model in which risky asset prices are at the core of the analysis—with the two key features highlighted above. First, we explore the role of the aggregate demand channel and interest rate frictions in causing recessions driven by a rise in the "risk premium"—our catchall phrase for shocks to asset valuations.

### A Risk-centric Model of Demand Recessions and Speculation

We theoretically analyze the interactions between asset prices, financial speculation, and macroeconomic outcomes when output is determined by aggregate demand. If the interest rate is constrained, a decline in risky asset valuations generates a demand recession. This reduces earnings and generates a negative feedback loop between asset prices and aggregate demand.

the risk-centric model uses a mapping from risks to architecture techniques that address them. For example, it can use the mapping from the risk "protocol may deadlock" to the technique "analyze protocol using FSP". The key element of the risk-centric model is the promotion of risk to prominence. What we choose to promote has an impact.
