Environmental concerns and advances in architectural technologies have lead to a greater number of green buildings or buildings with green, eco-friendly elements. However, from a practical standpoint, there is no incident reporting system in the world that tracks data on fire incidents in green buildings. Fire safety objectives are not explicitly considered in most green rating schemes, and green design features have been associated with photovoltaic panels and roof materials, lightweight timber frame buildings, and combustible insulation materials. Fire Safety Challenges of Green Buildings is the result of an extensive global literature review that sought to identify issues related to green building elements or features and ways to ensure those issues are tracked for future improvement. The book identifies actual incidents of fires in green buildings or involving green building elements, points out issues with green building elements that would increase fire risk, clarifies reports and studies that address ways to reduce fire risk in green design elements, and compares research studies that explicitly incorporate fire safety into green building design. The authors also pinpoint gaps and specific research needs associated with understanding and addressing fire risk and hazards with green building design. Using their data, the authors developed a set of matrices relating these green attributes and potential fire hazards. With these comprehensive tools, potential mitigation strategies for addressing the relative increase in fire risk or hazard associated with the green building elements and features have been identified. Fire Safety Challenges of Green Buildings is intended for practitioners as a tool for analyzing building safety issues in green architecture and developing methods for tracking data related to green design elements and their potential hazards. Researchers working in a related field will also find the book valuable.

From Book's Introduction: Today fire departments use many terms for educational fire and injury prevention programs. Programs differ in size and approach, but the goals are the same: Change the behavior of the public so that there are fewer dangerous situations, fires, and injuries. This guide uses a five-step planning process for developing and implementing successful fire and life safety public education programs. From identifying the fire and injury risks in the community, developing and implementing a program, and evaluating the results, planning is the process that ensures that the program strategies and initiatives really address the problems. This updated guide recognizes that fire prevention is now an important part of the larger goal of preventing injuries and unsafe situations. Fire departments often provide emergency medical services. Preventing injury, illness, and other unsafe situations is often part of the mission of saving lives.

The manual is designed as a comprehensive guide that helps fire and emergency service providers understand the concepts that form the foundation of risk management principles and practices. In addition, the manual directs the reader to sources of additional information and operational examples. The manual focuses on the practical application of risk management principles to fire department operations.

Yucca Mountain, located on the Nevada Test Site, is being considered as a potential repository site for spent nuclear fuel and high-level radioactive waste. To determine the suitability of Yucca Mountain as a repository, the Department of Energy constructed an underground Exploratory Studies Facility (ESF) where tests and experiments will be performed. This book addresses safety issues which will impact the construction and operation of the ESF and other similar underground facilities. The authors discuss proactive strategies for underground safety management with an emphasis on planning for safety, safety regulations, and the enforcement of such regulations. Also included are illustrations of successful approaches in creating a safe environment for those who work underground.
