Block diagram reduction Techniques - Transfer Function

Block Diagram Reduction Subsystems are represented in block diagrams as blocks, each representing a transfer function. In this unit we will consider how to combine the blocks corresponding to individual subsystems so that we can represent a whole system

Basic Elements of Block Diagram. The basic elements of a block diagram are a block, the summing point and the take-off point. Let us consider the block diagram of a closed loop control system as shown in the following figure to identify these elements. The above block diagram consists of two blocks having transfer functions $G(s)$ and $H(s)$.

Simplify the block diagram shown in Figure 3-42. Solution. First, move the branch point of the path involving H_1 outside the loop involving H_2 , as shown in Figure 3-43(a). Then eliminating two loops results in Figure 3-43(b). Combining two blocks into one gives Figure 3-33(c). A-3-2. Simplify the block diagram shown in Figure 3-13.

EXAMPLE PROBLEMS AND SOLUTIONS

Block diagram reduction is mostly a (control or signals and systems) textbook exercise, if one thinks about LTI (linear time-invariant) systems. If you want to extract the transfer function from a LTI system block description, use Mason ' s rule (Mason's gain formula - Wikipedia) because it is faster and simpler.

The block diagram of a practical feedback control system is often quite complicated. It may include several feedback or feedforward loops, and multiple inputs. By means of systematic block diagram reduction, every multiple loop linear feedback system may be reduced to canonical form.
