Over the decades, control theory has had deep and fruitful interactions with the theory of partial differential equations (PDEs). Well-known examples are the study of the generalized solutions of Hamilton-Jacobi-Bellman equations arising in deterministic and stochastic optimal control and the development of modern analytical tools to study the controllability of infinite dimensional systems governed by PDEs.

## Differential Equations

The part of financial mathematics that is concerned with the valuation of investment decision strategies

overlaps with the theory of control and optimisation, which is a traditional branch of mathematics with a wide and far-reaching range of applications.

Developments in both areas involve advanced theory from several areas of mathematics, including probability and stochastic processes, analysis, and partial differential equations.
