methodologies associated with the design of bridges utilized to support large aircraft loadings. Unlike their highway counterparts, there is very little information published and made available to airport bridge designers by those agencies responsible for the development of airport operation standards. Consideration is given to the derivation of aircraft loading parameters ranging from 450 to 590 Mg (1.0 million-1.3 million lb) vehicles, as ...

This paper also focuses on the unique dimensional characteristics of an aircraft bridge as required to meet strict safety guidelines for vehicle movements/operation. The information presented is based on constructed examples of innovative designs where these unique constraints have been safely met using steel girder, precast beam, and posttensioned concrete bridge solutions. A proposed design criteria is provided to aid in the future design of these important facilities.

Essential Considerations for Designing Aircraft Interiors. Modern day consumers have certain expectations when it comes to airline travel. For one thing, global aircraft interiors need to fit the idea of what plane travel should look like. But increasingly, passengers value comfort and luxury over simply getting from place to place, and they ...

Design Criteria for Bridges and Other Structures

Modern jet aircraft have doors on both sides. But have you ever noticed that passengers almost always board on the left side of the plane? At airports around the world, the design and layout of jet bridges follow this convention. And it's not just jet bridges;

Why Are Jet Bridges Almost Always On The Left Of The Aircraft?

Aircraft bridges must be designed for the substantial forces exerted by aircraft braking, affecting the lateral load in substructure design. Braking force of 70 percent of the live load is assumed in two recent taxiway bridge designs. And "deck design is more apt to be controlled by punching shear than flexure due to the heavy wheel loads."

The initial plans are prepared regarding the project, including the characteristics of the desired bridge, the site details, and the requirement of resources. The bridge design will be determined by the type of bridge being constructed. The main types of the bridges are beam, arch, truss, cantilever, and suspension.

Considerations in Bridge Design. Engineers have been designing bridges for thousands of years. A lot of thought goes into designing the perfect bridge, to ensure that the structure is safe, reliable and able to withstand the test of time. Of course, engineers today have access to more precise tools than the bridge designers of yesterday, allowing them, among other things, to prototype their work far earlier in the process.
