Universal Economics is a new work that bears a strong resemblance to its two predecessors, *University Economics* (1964, 1967, 1972) and *Exchange and Production* (1969, 1977, 1983). Collaborating again, Professors Alchian and Allen have written a fresh presentation of the analytical tools employed in the economic way of thinking. More than any other principles textbook, *Universal Economics* develops the critical importance of property rights to the existence and success of market economies. The authors explain the interconnection between goods prices and productive-asset prices and how market-determined interest rates bring about the allocation of resources toward the satisfaction of consumption demands versus saving/investment priorities. They show how the crucial role of prices in a market economy cannot be well understood without a firm grasp of the role of money in a modern world. The Alchian and Allen application of information and search-cost analysis to the subject of money, price determination, and inflation is unique in the teaching of economic principles. No one has ever done price theory better than Alchian that is, no one has ever excelled Alchians ability to explain the reason, role, and nuances of prices, of competition, and of property rights. And only a precious fewl can count them on my fingershave a claim for being considered to have done price theory as well as he did it. Donald Boudreaux, George Mason University. Armen A. Alchian (19142013), one of the twentieth centurys great teachers of economic science, taught at UCLA from 1958 to 1984. Founder of the UCLA tradition in economics, he has become recognized as one of the most influential voices in the areas of market structure, property rights, and the theory of the firm. William R. Allen taught at Washington University prior to joining the UCLA faculty in 1952. Along with research primarily in international economics and the history of economic theory, he has concentrated on teaching economics. Universal Economics is his third textbook collaboration with Armen Alchian. Jerry L. Jordan wrote his doctoral dissertation under the direction of Armen Alchian. He was Dean of the School of Management at the University of New Mexico, a member of President Reagans Council of Economic Advisors and of the U.S. Gold Commission, Director of Research of the Federal Reserve Bank of Saint Louis, and President and CEO of the Federal Reserve Bank of Cleveland.

Freshwater Ecology: Concepts and Environmental Applications is a general text covering both basic and applied aspects of freshwater ecology and serves as an introduction to the study of lakes and streams. Issues of spatial and temporal scale, anthropogenic impacts, and application of current ecological concepts are covered along with ideas that are presented in more traditional limnological texts. Chapters on biodiversity, toxic chemicals, extreme and unusual habitats, and fisheries increase the breadth of material covered. The book includes an extensive glossary, questions for thought, worked examples of equations, and real-life problems. Broad coverage of groundwaters, streams, wetlands, and lakes Features basic scientific concepts and environmental applications throughout Includes many figures, sidebars of fascinating applications, and biographies of practicing aquatic ecologists Materials are presented to facilitate learning, including an extensive glossary, questions for thought, worked examples of equations, and real life problems Written at a level understandable to most undergraduate students, with explanations of complex contemporary concepts in freshwater ecology described to promote understanding Featuring small chapters that mainly stand alone, this book can be read in the order most suited to the specific application

Winner of Choice Magazine - Outstanding Academic Titles for 2007 Buildings account for over one third of global energy use and associated greenhouse gas emissions worldwide. Reducing energy use by buildings is therefore an essential part of any strategy to reduce greenhouse gas emissions, and thereby lessen the likelihood of potentially catastrophic climate change. Bringing together a wealth of hard-to-obtain information on energy use and energy efficiency in buildings at a level which can be easily digested and applied, Danny Harvey offers a comprehensive, objective and critical sourcebook on low-energy buildings. Topics covered include: thermal envelopes, heating, cooling, heat pumps, HVAC systems, hot water, lighting, solar energy, appliances and office equipment, embodied energy, buildings as systems and community-integrated energy systems (cogeneration, district heating, and district cooling). The book includes exemplary buildings and techniques from North America, Europe and Asia, and combines a broad, holistic perspective with technical detail in an accessible and insightful manner.

Where should the United States focus its long-term efforts to improve the nation's environment? What are the nation's most important environmental issues? What role should science and technology play in addressing these issues? Linking Science and Technology to Society's Environmental Goals provides the current thinking and answers to these questions. Based on input from a range of experts and interested individuals, including representatives of industry, government, academia, environmental organizations, and Native American communities, this book urges policymakers to use social science and risk assessment to guide decisionmaking. Monitor environmental changes in a more thorough, consistent, and coordinated manner. Reduce the adverse impact of chemicals on the environment. Move away from the use of fossil fuels. Adopt an environmental approach to engineering that reduces the use of natural resources. Substantially increase our understanding of the relationship between population and consumption. This book will be of special interest to policymakers in government and industry; environmental scientists, engineers, and advocates; and faculty, students, and researchers.

Identifies non-government facilities active in commercial research, including development of products and processes. Arrangement is alphabetic, geographic, and by concept classification.

This publication, prepared jointly by the WHO, the World Meteorological Organization and the United Nations Environment Programme, considers the public health challenges arising from global climate change and options for policy responses, with particular focus on the health sector. Aspects discussed include: an overview of historical developments and recent scientific assessments; weather and climate change; population vulnerability and the adaptive capacity of public health systems; the IPCC Third Assessment report; tasks for public health scientists; the health impacts of climate extremes; climate change, infectious diseases and the level of disease burdens; ozone depletion, ultraviolet radiation and health; and methodological issues in monitoring health effects of climate change.
