Genetic variation comes in the form of different alleles for any given gene. A population's gene pool is the combined alleles of all the individuals in a population. Biologists measure the genetic diversity of a population by calculating the frequencies, or rates, of each allele in the gene pool.

## *Genetic Variation | National Geographic Society*

The majority of genetic variation in the human species exists within local populations, and a smaller fraction (typically about 10 to 15%) is found among geographic races. It is also important to consider the pattern of among-group variation as well as the magnitude.
