Local Anesthesia In
Dentistry Clinical

There are two local
anesthetic agents used in
dentistry that reportedly
induce methemoglobinemia.
The first agent is the
topical local anesthetic
benzocaine and the second
agent is the injectable (and
topical) local anesthetic
prilocaine. The mechanism of
action is that both of these
anesthetics oxidize
hemoglobin to methemoglobin.

Local anesthesia is a numbing medication that makes a small area of your body insensitive to pain. It comes in handy for minor surgeries and while stitching up wounds. Local Anesthesia in dentistry is common and various dentists use it for many procedures on a daily basis. Lignocaine or Lidocaine is the most commonly used Local anesthetic agent.
