In contrast, managing forests as complex adaptive system is a bottom-up approach. Besides the provision of ecosystem services, management activities also consider the adaptive capacity, i.e., the ability of ecosystem to respond to changes. The adaptive or transformative capacity of ecosystem is more and more important in a world that is changing faster and faster and where foresters have less ability to “fix” things, e.g., due to limited budgets, more constraints on pesticides, etc.

Managing Forests as Complex Adaptive Systems

Classical forest management has worked out a series of forest regulation methods with the aim of obtaining the "fully regulated" forest. Considering the forest as a complex biological adaptive system means overcoming the reductionist and mechanist paradigm, and entails a shift towards a systemic approach in

We argue here that viewing forest ecosystems as complex adaptive system provides a better alternative for both production- and conservation-oriented forests and forestry. We propose a set of broad principles and changes to increase the adaptive capacity of forests

Managing Forests as Complex Adaptive Systems
As the movement to create healthy forests moves forward, it promises to become a template for the use of new "complex systems" tools to address chronic problems, such healthcare, education and economic policy. Managing Forests as Complex Adaptive system is a remarkably readable book.
