Most mini-implants are made from either titanium or titanium alloy and histological studies show variable levels of bone-implant contact (BIC).^{2,3} However, it is misleading to refer to this as osseointegration. Rather, clinical usage and percussion indicate

The new Mini and Midi Implants are the perfect system to provide greater denture stability for those refused regular implants due to a lack of bone, or who simply cannot afford the cost of conventional implants. Once the implants are secured, a tailor made crown (the tooth itself) is secured to the implant.

When the mini-implant displays obvious lateral mobility with light digital pressure then this indicates failure and the mini-implant should be removed. Fortunately, most mini-implant failures become clinically evident within the first few months of insertion, 4,8,9 enabling early replacement or a modification to the treatment plan. Conversely, when a mini-implant feels firm after two

Results: No implant failed before restoration. One implant led an adjacent tooth pulp necrosis after the implantation, but the natural tooth and implant were successfully retained by root canal therapy. 36 implants in 36 patients who were followed-up were successful and their aesthetic results were satisfactory. Conclusion: Immediate loaded implant with Osstem MS mini-implant has good clinical prosthetic effects in the edentulous space of 5-6 mm.
