Protection and Restoration in Optical Networks

Protection and restoration are critical network design issues for optical networks since even a single failure for a short duration may result in huge data loss due to the large capacity of optical fibers. However, few studies have been done on these issues for optical burst switching (OBS) networks. Protection and restoration are essential mechanisms for guaranteeing more reliable traffic delivery services.

Network Recovery

Fault management in optical network is done through reserving backup resources in advance called protection or discovering spare backup resources in an online manner called restoration as defined by Mohammad Ilyas and Hussein T. Muftah, which can be further classified as path protection/restoration and link protection/restoration as shown in Figure: 1.

Protection and Restoration Schemes in Optical Networks: A ...

The down side to restoration as a protection technique is that the recovery time is not fast enough. The second approach is to have a predefined backup path computed before the failure. This approach is said to be failure independent and it takes less processing time to recover as compared to the failure dependent approach.

Path protection - Wikipedia

MPLS Protection and Restoration, MPLS Recovery As you know, we can prioritize some of the traffic with MPLS-TE because of their nature. The high priority can be given to the voice and video traffic. Because they are fragile traffic types.

MPLS Protection and Restoration, MPLS Recovery IpCisco

Multiple recovery mechanisms that provide different levels of protection or restoration against different failure modes are available in mesh networks. Channel-, link-, segment-and path- protection are the most common protection schemes. P-cycles is another type of protection that leverages and extends ring-based protection.
