Power electronics is the application of solid-state electronics to the control and conversion of electric power. The first high power electronic devices were mercury-arc valves. In modern systems, the conversion is performed with semiconductor switching devices such as diodes, thyristors, and power transistors such as the power MOSFET and IGBT. In contrast to electronic systems concerned with transmission and processing of signals and data, in power electronics substantial amounts of electrical

The conversion of AC into DC is called Rectification. Electronic Devices can convert AC power into DC power with high efficiency. Consider the given circuit. Assume the diode to be ideal i.e., $V_f = 0$, $R_r = \text{Infinite}$, $R_f = 0$. During the positive half cycle, the diode is forward biased and it conducts and hence a current flows through the load ...
