## Power Series Solutions Differential Equations

This is likewise one of the factors by obtaining the soft documents of this power series solutions differential equations by online. You might not require more times to spend to go to the book establishment as capably as search for them. In some cases, you likewise do not discover the declaration power series solutions differential equations that you are looking for. It will very squander the time.

However below, with you visit this web page, it will be

If a point is not an ordinary point we call it a singular point. The basic idea to finding a series solution to a differential equation is to assume that we can write the solution as a power series in the form,  $y(x) = \sum_{n=0}^{\infty} a_n(x - x_0)^n$ .  $y(x) = \sum_{n=0}^{\infty} a_n(x - x_0)^n$  (2) and then try to determine what the  $a_n$ .

general, such a solution assumes a power series with unknown coefficients, then substitutes that solution into the differential equation to find a recurrence relation for the coefficients. 6.3: The Laguerre Equation

6: Power Series Solutions of Differential Equations ...

The derivative of a power series will be,  $f'(x) = a_1 + 2a_2(x - x_0) + 3a_3(x - x_0)^2 + \dots = \sum_{n=1}^{\infty} n a_n (x - x_0)^{n-1}$ .

So, all we need to do is just differentiate the term inside the series and we're done. Notice as well that there are in fact two forms of the derivative.

Note that the general solution contains one parameter ( $c_0$ ), as expected for a first order differential equation. This power series is unusual in that it is possible to express it in terms of an elementary function. Observe: It is easy to check that  $y = c_0 e^{x^2/2}$  is indeed the solution of the given differential equation,  $y' = xy$ . Remember: Most power series cannot be expressed in terms of familiar, elementary functions, so the final answer would be left in the form of a power series.

Solution at singular point. It was explained in the last chapter that we have to analyse first whether the point is ordinary or singular. In the case the point is ordinary, we can find solution around that point by power series. The solution around singular points has been left to explain. For example DE  $(x-1)^2x^4y'' + 2(x-1)xy' - y = 0$

EXAMPLE 1 Power Series Solution Use a power series to solve the differential equation Solution Assume that is a solution. Then, Substituting for and you obtain the following series form of the differential equation. (Note that, from the third step to the fourth, the index of summation is changed to ensure that occurs in both sums.)

elementary functions (that is, in closed form in terms of polynomials, rational functions,  $e^x$ ,  $\sin x$ ,  $\cos x$ ,  $\ln x$ , etc.). A power series solution is all that is available. Such an expression is nevertheless an entirely valid solution, and in fact, many specific power series that arise from solving particular differential equations have been extensively studied and hold prominent places ...

$$a_n]x^n = 0.$$
 Because power series expansions of functions are unique, this equation can be true only if the coefficients of each power of  $x$  are zero. So we

17.4: Series Solutions of Differential Equations ...  
Solving linear differential equations with constant coefficients reduces to an algebraic problem. There is no similar procedure for solving linear differential equations with variable coefficients. With the exception of special types, such as the Cauchy equations, these will generally require the use of the power series techniques for a solution.

Nonlinear equations. The power series method can be applied to certain nonlinear differential equations, though with less flexibility. A very large class of nonlinear equations can be solved analytically by using the Parker – Sochacki method. Since the Parker – Sochacki method involves an expansion of the original system of ordinary differential equations through auxiliary equations, it is not simply referred to as the power series method.
