Here $u = u(x, y)$, $v = v(x, y)$, and subscripts x, y denote partial derivatives. Equations of this form are frequently found in problems of mechanics of continua (cf. the ex- amples in sections 5-7). The system (1.1) possesses the same structure as the Cauchy-Riemann equations. $U_x = V_y$.

ON A CLASS OF DIFFERENTIAL EQUATIONS IN MECHANICS OF CONTINUA*

In this work Prager aimed to provide students with the common fundamentals of the various areas of hydrodynamics, elasticity, plasticity, etc., that constitute continuum mechanics. A great expert in the use of computers, Prager published Introduction to basic FORTRAN programming and numerical methods in 1965. Hamming describes the work as follows:-

The Drucker-Prager yield criterion is a pressure-dependent model for determining whether a material has failed or undergone plastic yielding. The criterion was introduced to deal with the plastic deformation of soils. It and its many variants have been applied to rock, concrete, polymers, foams, and other pressure-dependent materials. The Drucker-Prager yield criterion has the form $\sqrt{J_2} = A + B I_1$

{\displaystyle {\sqrt {J_{2}}}=A+B~I_{1}}

 where I_1

{\displaystyle I_{1}}
