## **Lesson 11: Principal Components Analysis (PCA)**

Principal Component Analysis, or PCA, is a dimensionality-reduction method that is often used to reduce the dimensionality of large data sets, by transforming a large set of variables into a smaller one that still contains most of the information in the large set.

## **A Step-by-Step Explanation of Principal Component Analysis**

Principal Component Analysis (PCA) is one of the most popular machine learning technique. It reduces the dimension of a given data set, making the data set more approachable and computationally cheaper to handle, while preserving most patterns and trends. This makes PCA an excellent tool for exploratory data analysis.

Principal component analysis is an approach to factor analysis that considers the total variance in the data, which is unlike common factor analysis, and transforms the original variables into a smaller set of linear combinations. The diagonal of the correlation matrix consists of unities and the full variance is brought into the factor matrix.
