The National Cancer Institute's (NCI) Clinical Trials Cooperative Group Program has played a key role in developing new and improved cancer therapies. However, the program is falling short of its potential, and the IOM recommends changes that aim to transform the Cooperative Group Program into a dynamic system that efficiently responds to emerging scientific knowledge; involves broad cooperation of stakeholders; and leverages evolving technologies to provide high-quality, practice-changing research.

Centers of the Cancer Universe: A Half-Century of Progress Against Cancer reviews 50-years of progress in cancer research and treatment since the signing of the 1971 National Cancer Act, and the role played by the NCI-designated cancer centers created by the Act.

This timely guide details, in a highly accessible manner, the pathogenesis, epidemiology, and major complications of catheter-related infections (CRIs) as well as the types of catheters and etiological agents involved-providing practical approaches to the diagnosis, management, and prevention of CRIs.

The New Prescriber is a comprehensive, accessible textbook that provides essential coverage of the three core components for prescribing: the client/patient, the evidence, and the pharmacology. Divided into three sections, this text first looks at the consultation with the patient, and outlines legal, professional and ethical frameworks which guide medical and non-medical prescribing. The second section is devoted to evidence-based practice, highlighting key skills essential to all clinicians. This section encourages the student to identify why evidence-based practice should underpin prescribing decisions. The third and final section is concerned with pharmacology. The student is introduced to basic concepts of pharmacodynamics and pharmacokinetics, adverse drug reactions and variability of response. The importance of these pharmacological principles is highlighted throughout the subsequent discussion of drug groups affecting major body systems. Key features: Pulls together all key elements of prescribing using an integrated approach 'Stop and Think' boxes and practice application activities provided throughout, enabling the reader to link theory to practice Key terms and glossary provided This text is invaluable for all nursing, health and medical students taking courses in prescribing and pharmacology.

This latest volume in the series Psychological Assessment - Science and Practice describes the current state-of-the-art in test development and construction. The past 10-20 years have seen substantial advances in the methods used to develop and administer tests. In this volume many of the world's leading authorities collate these advances and provide information about current practices, thus equipping researchers and students to successfully construct new tests using the best modern standards and techniques. The first section explains the benefits of considering the underlying theory when designing tests, such as factor analysis and item response theory. The second section looks at item format and test presentation. The third discusses model testing and selection, while the fourth goes into statistical methods that can find group-specific bias. The final section discusses topics of special relevance such as multi-trait multi-state analyses and development of screening instruments.

Precision medicine is rapidly becoming the standard-of-care for the treatment of cancer patients. This is made possible, in part, by the ready availability and reasonable costs of comprehensive DNA and RNA sequencing assays. However, precision medicine is complex and incorporates entirely new types of data and treatment paradigms that are outside of the training of most oncologists in practice today. Precision Medicine Oncology: A Primer is a concise review of the fundamental principles and applications of precision medicine, intended for clinicians, particularly those working in oncology. It provides an accessible introduction to the technological advances in DNA and RNA sequencing, gives a detailed overview of approaches to the interpretation of molecular test results and their point-of-care implementation for individual patients, and describes innovative clinical trial designs in oncology as well as characteristics of the computational infrastructures through which massive quantities of data are collected, stored, and used in precision medicine oncology.
