In the 1960s fundamental topological problems were solved by applying the methods of differential topology: It was found that the characteristic classes of real manifolds were topologically invariant; the relation between the categories of differentiable, piecewise-linear and topological manifolds were clarified; the methods of classification of smooth manifolds were generalized to include non-simply-connected manifolds (though admittedly not very effectively); and algebraic K -theory and ...

Roughly, they are geometrical objects that can be endowed with coordinates; by using coordinates one can apply on them differential and integral calculus, but the results are coordinate-independent. Examples of manifolds start with open domains in Euclidean space \mathbb{R}^n and "multi-dimensional surfaces" such as the n -sphere S^n and n -torus T^n .
