Spatial and Spatio-Temporal Epidemiology is a peer-reviewed scientific journal that provides a home for high quality work which straddles the areas of GIS, epidemiology, exposure science, and spatial statistics. The journal focuses on answering epidemiological questions where spatial and spatio-temporal approaches are appropriate. The methods should help to advance our understanding of infectious and non-infectious diseases in humans.

Omitting superscript, β_0 is the model constant term, S_{str} is the structured spatial random effect, S_{unstr} is the unstructured random effect, T is the temporal term and ST accounts for the spatio-temporal random effect. The structured component assumes a spatial correlation among the countries such that neighbouring countries are assumed to have more

influence on one another than those far apart while the unstructured component assumes the countries are independent of one another.

Spatial and Spatio-temporal Epidemiology

Spatial data can analyze on many levels, zip codes, census tract, state, geocode, etc. Temporal data is often analyzed as multiple data points per observation over time and can be measured by just as many ways as the spatial data, if not more. One can also look at events by year, month, minute, second, but this must also be linked to spatial data.

Each spatio-temporal density estimate requires a separate smoothing bandwidth for the spatial and the temporal margins of the data. As in the purely spatial setting, it is recommended to choose the same values of these bandwidths between the case and control estimates.
