Triple Integration with Maple Copyright ' 1999, 2001 by James F. Hurley, University of Connecticut Department of Mathematics, Unit 3009, Storrs CT 06269-3009. All rights reserved. Maple is helpful in setting up triple iterated integrals over regions in R 3. Just as for double integrals, the key step is determining the limits of integration.

We can use Maple to check triple integrals, using the int command three times. If we want to integrate the function f(x,y,z) = x + y^2 + z^3 over the cube bounded by the planes x=1, x=3, y=-1, y=2, z=0, and z=1, we evaluate by simply executing the command: > Int(Int(Int(x+y^2+z^3, x=1..3), y=-1..2),z=0..1)=

B = [a,b] x [c,d] x [r,s] B = [a, b] x [c, d] x [r, s] Note that when using this notation we list the x x ' s first, the y y ' s second and the z z ' s third. The triple integral in this case is, B f (x , y , z) d V = ∫ ∫ ∫ b a f (x , y , z) d x d y d z B f (x , y , z) d V = ∫ ∫ ∫ a b f (x , y , z) d x d y d z.

If any of the integration limits of a definite integral are floating-point numbers (e.g. 0.0, 1e5 or an expression that evaluates to a float, such as exp(-0.1)), then int computes the integral using numerical methods if possible (see evalf/int).Symbolic integration will be used if the limits are not floating-point numbers unless the numeric=true option is given.
