The Universal Verification Methodology is a standardized methodology for verifying integrated circuit designs. UVM is derived mainly from the OVM which was, to a large part, based on the eRM for the e Verification Language developed by Verisity Design in 2001. The UVM class library brings much automation to the SystemVerilog language such as sequences and data automation features etc., and unlike the previous methodologies developed independently by the simulator vendors, is an Accellera standar

Universal Verification Methodology - Wikipedia

The Universal Verification Methodology (UVM) is a standard verification methodology from the Accellera Systems Initiative that was developed by the verification community for the verification community. UVM represents the latest advancements in verification technology and is designed to enable creation of robust, reusable, interoperable verification IP and testbench components.

Universal Verification Methodology (UVM) - Mentor Graphics

The Universal Verification Methodology (UVM) is an open source SystemVerilog library allowing creation of reusable verification components and assembling test environments utilizing constrained random stimulus generation and functional coverage methodologies.

Basic UVM. The Basic UVM (Universal Verification Methodology) course consists of 8 sessions with over an hour of instructional content. This course is primarily aimed at existing VHDL and Verilog engineers or managers who recognize they have a functional verification problem but have little or no experience with constrained random verification or object-oriented programming.

The UVM methodology applied to the SystemVerilog Testbench for VITAL models should provide a unique VE that can be reused later with minimal changes. The initial version of the SystemVerilog VITAL testbench, which is based on UVM, is intended for verification of serial flash family of VITAL models.

UVM based Design Verification of FIFO – IJERT

Since our verification environment is UVM based, hence we write sequences to generate stimulus for register Write and Read transactions. RAL helps us to abstract the register layer and helps us to create a infrastructure which is independent of the the DUT interface. In a simplistic view, its like 2 layers along with the DUT.

What is UVM RAL? | Universal Verification Methodology

For the past decade or so, the Universal Verification Methodology (UVM) has been the de facto verification methodology supported by the entire EDA industry. But as chips become more heterogeneous, more complex, and significantly larger, UVM is running out of steam. Consensus is building that some fundamental changes are required, moving tools up a level of abstraction and making them more agnostic about different architectures.
