1. Radio wave propagation. A radio wave is a form of radiant energy (electromagnetic radiation) that propagates at the speed of light (186,000 miles or 300,000,000 meters per second). The following description of wave motion is based on FM 11-64, Transmission Lines, Wave Propagation, and Antennas. a.

Tropospheric scatter is a method of communicating with
microwave radio signals over considerable distances – often

up to 300 kilometres, and further depending on terrain and climate factors. This method of propagation uses the tropospheric scatter phenomenon, where radio waves at UHF and SHF frequencies are randomly scattered as they pass through the upper layers of the troposphere. Radio signals are transmitted in a narrow beam aimed just above the horizon in the direction of the receiver ...

These ionized particles reflect the sky waves back to the Earth. A powerful sky wave may be reflected several times between the Earth and the ionosphere. Sky waves are used by amateur ham radio operators and for military communication. Radio Wave Propagation. In Radio communication systems, we use wireless electromagnetic waves as the channel. The antennas of different specifications can be used for these purposes.
