Flat-Field Correction You can use Flat-Field Correction to remove shading or lens cast, a typical optical artifact, from your digital photos. Shading is a generic form of Lens Vignetting, where light falloff can be asymmetrical and can have a color cast. For example, green on the left side of the image and magenta on the right side.

[Flat-Field Correction - Adobe Help Center](#)

Flat-field correction is a technique used to improve quality in digital imaging. It cancels the effects of image artifacts caused by variations in the pixel-to-pixel sensitivity of the detector and by distortions in the optical path. It is a standard calibration procedure in everything from personal digital cameras to large telescopes.

Depending on the variant, a flat field correction corrects for dark signal non-uniformities (DSNU), photo response non-uniformities (PRNU) and/or artifacts caused by the illumination and illumination optics. In this blog post we will briefly explain the required steps to make flat field correction work in practice. Dark and bright field correction

According to Adobe, the Adobe ® DNG Flat Field is a plug-in for Lightroom to correct an optical phenomenon called shading (also known as “lens cast”). Shading is a more general form of standard lens vignetting: with shading, the light falloff can be asymmetric and can have a color cast (e.g., green on the left side of the image, and magenta on the right side).

Flat Field Correction For Lightroom - The Camera Forum®

Flat-field correction is used to compensate for the non-uniformity characteristics of the camera and lens combination. A well known example of such non-uniformity is vignetting - a peripheral darkening of the image, more pronounced in the corner areas.

Flat-Field - RawPedia

A flat field is the response of the telescope-camera system to a source of uniform illumination. Flat field frames are used to correct for anomalies in the optical path, such as specs of dust on the optical surfaces, sensitivity variances between pixels in the CCD, and illumination variations within the optical

If a precise profile is used for correction then the corrected image is perfectly flat. If the profile is wrong by, for example, 1% at certain image coordinates then the corrected image deviates from the perfectly flat image by 1% in the opposite direction.

To use this feature, first select all of the photographs you want to correct (either with the calibration frame at the beginning or end of the set), then choose Library>Flat-Field Correction. This opens the ‘Flat-Field Correct and Convert Photos to DNG’ dialog, with practical and file-handling options. Once you hit OK, Lightroom automatically detects the calibration frames and applies the flat-field correction to the corresponding photos before converting them to the DNG file format.

Image Intensity Processing - ImageJ

While flat-fielding correction is important for achieving good quality images, it is absolutely essential for accurate photometric measurements. With a bright sky background, any pixel-to-pixel variations in sensitivity are imprinted into the image; the more sensitive pixels show up as brighter dots.

Prepare a slide of an appropriate flat-field solution by placing a drop between a slide and a coverslip. Mount the slide on the microscope and focus on the solution. If there is an air bubble in the solution, it's easy to focus on that; otherwise you can use the edge of the coverslip to focus on.

How to Acquire Flat Field Correction Images – Nikon ...

The flat field correction is an optional step, it may not be needed in the case of objects exposed in the short wavelength range of the echelle (images centered at Å). If you do not want to perform a flat field correction, set the echelle keyword FFOPT to NO and skip this section.

Flat Field can allow one to make a fairly exact correction for luminance vignetting without also automatically applying digital corrections for distortion and/or chromatic aberration.

However, a distortion caused by the optics cannot be eliminated by a flat field correction. Distortions like these can only be eliminated from the recorded data by applying a software fix. In order to keep the effort as low as possible, we recommend the use of high quality lenses, since they show lower distortion.
